

EC - Local Search

Assignment 3

Adam Korba - 151962

Łukasz Sztukiewicz - 151959

PROBLEM DESCRIPTION

We are given three columns of integers with a row for each node. The first two columns contain x and y coordinates of the node positions in a plane. The third column contains node costs. The goal is to select exactly 50% of the nodes (if the number of nodes is odd we round the number of nodes to be selected up) and form a Hamiltonian cycle (closed path) through this set of nodes such that the sum of the total length of the path plus the total cost of the selected nodes is minimized.

The distances between nodes are calculated as Euclidean distances rounded mathematically to integer values. The distance matrix should be calculated just after reading an instance and then only the distance matrix (no nodes coordinates) should be accessed by optimization methods to allow instances defined only by distance matrices.

PSEUDOCODE

Greedy localsearch

Generate initial solution x

repeat

for each $y \in N(x)$ in a random order

if $f(y) < f(x)$ then

$x := y$

until no better solution was found after checking the whole $N(x)$

Steepest version

Generate initial solution x

repeat

find the best solution $y \in N(x)$

if $f(y) < f(x)$ then

$x := y$

until no better solution was found after checking the whole $N(x)$

SCORES

| <i>method</i> | TSPA | | | TSPB | | |

| intra_edge_greedy_random | 170.11 | 145.46 | 223.47 | 158.16 | 140.42 | 188.50 |
| intra_node_greedy_random | 171.58 | 130.82 | 228.00 | 161.65 | 130.12 | 190.37 |

NUMBER OF ITERATIONS

We were surprised by execution times so we decided to also inspect number of iterations for each local search method

| method | TSPA | | | TSPB | | |
|-------------------------------|-----------------|-------------|-------------|-----------------|-------------|-------------|
| | AVERAGE of iter | MIN of iter | MAX of iter | AVERAGE of iter | MIN of iter | MAX of iter |
| intra_node_steepest_heuristic | 5 | 1 | 12 | 10 | 5 | 17 |
| intra_node_greedy_heuristic | 5 | 1 | 18 | 11 | 6 | 21 |
| intra_edge_steepest_heuristic | 9 | 3 | 17 | 10 | 5 | 16 |
| intra_edge_greedy_heuristic | 11 | 2 | 26 | 11 | 5 | 27 |
| intra_edge_steepest_random | 134 | 121 | 155 | 134 | 117 | 151 |
| intra_node_steepest_random | 155 | 123 | 193 | 154 | 125 | 186 |
| intra_node_greedy_random | 415 | 322 | 517 | 418 | 342 | 489 |
| intra_edge_greedy_random | 418 | 366 | 475 | 417 | 370 | 467 |

CONCLUSIONS

In the end local search methods allowed us to get slightly better solutions than previously used greedy methods, however not all methods were equal.

- Intra move methods: edge exchange has proven to be consistently better than node exchange as it allows for introducing more sophisticated changes
- Steepest vs greedy: steepest performed slightly better than greedy in most cases, surprising result was that greedy was much slower, it might be due to some compiler magic that is done on the steepest side, as the algorithm is much simpler (*less branches, no randomization, no additional memory allocation*)
- Starting conditions: Is is self-evident that starting with some good heuristic solution is very beneficial for local search, results were much better when starting with **greedy cycle** solution and execution times were reduced dramatically.
